TUBE INFORMATION	<ul style="list-style-type: none">The Bivona Tight to the shaft (TTS) tracheostomy tube is made of soft silicone material which conforms easily to the users anatomy.The cuff of the Bivona TTS is a high pressure low volume cuff so is not recommended for those who have their cuff inflated for most of the day.The tight to the shaft cuff contracts tightly around the shaft of the tube when deflated. This reduces resistance to airflow around the tube, facilitating speech.The Bivona TTS is a single patient item that can be sterilised and reused up to 10 times. 
CUFF INFLATION	<ul style="list-style-type: none">The cuff of the Bivona TTS is filled with WATER not air. A nominated amount of sterile water or water for irrigation is introduced into the pilot line using a 10mL non luer lock syringe. <p>Volume of water in cuff: _____ mLs</p>
CLINICAL ALERTS	<ul style="list-style-type: none">The Bivona TTS is a single lumen tube, care should be taken to avoid secretions collecting in the tube causing blockage.Avoid use of this tube in patients with minimal cuff down time. The cuff is a low volume, high pressure design.The cuff on this tube is filled with water not air. Air will leak out of the cuff over time and it will deflate.Cuff pressure can NOT be measured with a manometer. Record the number of mLs required to achieve an airtight seal using the minimal occlusive volume (MOV) technique. (Contact TRAMS if further information is required)Do not use an inner cannula in this tube.
